

# Delay-period ensemble selection across the bilateral ALM-striatum circuit

Gray shading: delay context supplied to the model • amber shading: held-out response epoch forecast

All recorded units

Selected delay-encoding units

## Selection criteria

- learned sparse gate ranks a neuron within the top fraction of its region
- rank is stable within its preferred class across training trials (default  $\geq 70\%$ )
- neuron has measurable delay activity; class modulation ( $\eta^2$ ) is reported
- unit identities are never pooled across recording sessions

left ALM: 2/8 (median stability 0.83)  
right ALM: 1/8 (median stability 0.83)  
left Striatum: 1/8 (median stability 0.83)  
right Striatum: 2/8 (median stability 0.92)
